## Rust not working windows 10 start menu

Does your rust keep falling? Don't worry about it anymore! We have some of the best solutions and fixes that have helped players around the world. Rust is an online multiplayer survival game where you collect materials from the wilderness to basically stay alive. All the time, you need to be aware of PvP encounters and repel yourself alone or with your friends. Rust's developers have been amazing in constantly providing updates and patches, but several users still say rust keeps crashing. Therefore, this can be more of a problem for you or some problem with game installation files. Whatever the reason, we're here to help you locate the problem so you can get your game back running. How to fix Rust falls constantly? The most common reasons why users encounter crashes are due to outdated drivers or a faulty file installation in the game directory. Several methods are listed below that have helped many users, including you, prevent Rust from crashing. Look at them! Method 1: Update your graphics driver Rust has been around for some time, exactly 2013. Therefore, it is unlikely that you may even need the latest drivers to play this game. However, the game is constantly patched up, and there may be certain features that are only compatible with the latest video drivers. You can download the latest drivers using two options. You can either visit the video card manufacturer's download page and download the driver update manually, or use Windows Device Manager to download and install updates. If you decide to select the first option, here are the driver download pages for the most common Group Policy objects: Intel, AMD, NVIDIA, Gigabyte. To update through Device Manager: To open Device Manager, search the Start menu to open it. Next, expand the Video Adapters arrow and select the video card. (If you have two graphics cards installed, usually NVIDIA and Intel, select NVIDIA Graphics). Right-click the video card, and then click Update Driver. A new window opens, click Find Drivers Automatically. If you had pending driver updates, Windows automatically downloads and installs them from the Internet. After Windows installs the new driver updates, restart your computer to make sure that the changes are installed correctly. If you want an even easier way to download and manage the latest drivers, you can try automatic updaters that are available to different video card manufacturers. A few: NVIDIA's GeForce Experience, AMD's Radeon Software, and Intel's Driver & Support Assistant. Method 2: Check the integrity of the installation file (Steam) It is possible that Rust's game files may have been corrupted or in the wrong place during the installation process or updates, and that is the likely reason why Rust keeps crashing. Lucky for us, Steam has built-in file integrity This feature basically allows you to scan scan directory to see if any corrupted files are missing or missing. To do this, follow the simple steps listed below: Go to your Steam game library. Right-click Rust. When the drop-down menu appears, click Properties. The Game Properties window now opens. Click the Local Files tab, and then click Confirm Game File Integrity... Steam will now perform a scan to check the integrity of the files. If everything is installed correctly, it will read All files have been successfully verified. If you have missing or corrupted files, Steam downloads and installs them automatically. If Rust still crashes, we recommend that you completely reinstall the game. Method 3: Make sure you meet the system requirements Rust is an older game, so it usually works pretty well even with small graphics drivers. You are up to an average of 30-45 FPS on most laptop GPU, such as 940MX, 930M, etc. However, if you play on an ancient machine with Intel HD graphics, it will be difficult for you to try to perform this game. In fact, in most cases, the GPU and processor gas, which apparently forces you to crash your game. The general minimum and recommended system requirements required for smooth use of Rust are listed below. Minimum requirements: Requires a 64-bit processor and operating system operating system: Windows 8.1 64bit Processor: Intel Core i7-3770 / AMD FX-9590 or better Memory: 10 GB RAM Graphics: GTX 670 2GB / AMD R9 280 better DirectX: Version 11 Network: Broadband Internet connection Storage: 20 GB available mode Recommended requirement: Requires: Requires 64-bit processor and operating system OPERATING SYSTEM: Windows 10 64bit Processor: Intel Core i7-4790K / AMD Ryzen 5 1600 Memory: 16GB RAM Graphics: GTX 980 / AMD R9 Fury DirectX: Version 12 Network: Broadband Internet Connection Storage: 20GB free space Make sure you meet at least the minimum requirements for a smooth experience while playing this game. In addition, Steam specifically recommends using solid state drive (SSD) for storage space. The hard drive usually has very long loading times, especially in a game like Rust. Method 4: Free up hard disk space You may not realize how much storage space games take up over time. If you're low on hard disk space, games start loading very slowly and sometimes even crash when it starts. A general rule of thumb is that you should leave 15-20% free space on your hard disk. Moreover, you can use windows' built-in Disk Resending app to clear unwanted files. Last words: We hope that at least one of the above methods had helped you get your game back running. If you have any questions or concerns, please leave them in the comments below. We'd be happy to help you. Rust stops responding repeatedly after starting or During?
